APCP Information – Standing Frames Information for parents and carers

'Standing is part of everyday life and your child is no different'

Why stand?

Many carers and parents of children who are unable to stand ask this question. There are many advantages of standing from an early age.

Some children need support for a short time and others will need help into adult life. There are many types of standing frame and each child will be assessed on an individual basis by their physiotherapist.

Bone development

Taking weight through your bones encourages bone growth and may help to improve bone density. It can also help to form the ball and socket joint of the hips and improve the structure of the hip joint in early life.

Kidneys and digestion

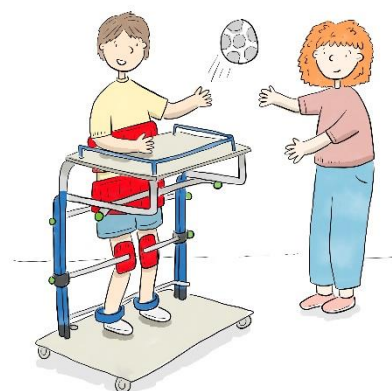

In standing gravity assists the drainage of the kidneys and bladder, which is thought to be beneficial. When standing, children can digest their food more easily and may suffer less reflux, indigestion and constipation.

Circulation and breathing

Muscle tone is improved with standing and this in turn assists with circulation. The bottom of the lungs can sometimes be squashed sitting down in a chair and can open up more in standing. This means deeper breaths can be taken and more oxygen is available.

Hand function and posture

In standing, a child's body is better aligned, their head control may be better and this in turn helps their ability to play, draw or write.

Stretching and positioning

Standing, stretches out muscles in the legs and back and encourages joints to be straighter and better aligned. This may help keep better range of movement in these joints for longer and help prevent painful joints in later life.

Skin

Standing may help with skin care by relieving pressure caused by sitting for long periods.

Social interaction

Standing for appropriate activities such as painting at an easel may help your child interact better with their peers at school, as it will put them on an eye-to-eye level. This can improve self-confidence and self-esteem. A standing frame may help a child feel safe during standing and allow them to direct their attention to learning

How often should a child stand?

It is recommended that a child should stand for a minimum of an hour, four or five times a week. However, this should be based on the individual needs of the child. Please talk to your physiotherapist.

Getting in and out of standing frames

While your child is small, it is easier to get them in and out of a standing frame and your therapist will show you how to do this. You should always follow the safety instructions for your equipment. Your child should stand as symmetrically as possible, with back and hips straight, legs equally apart and taking weight evenly through both feet.

As your child grows, a hoisting system may be introduced by your therapist, who will explain and demonstrate this technique.

This leaflet has been produced after a review of literature by the APCP National Committee and where there is a lack of evidence, a consensus of expert opinion is agreed, correct at time of publication.
